

TREE COTTON MANUFACTURING PROCESS

From Raw Kapok Pods to Soft Tree Cotton

1 Kapok pods are harvested and sun-dried to remove moisture and prepare for processing.

2 The dried pods are opened and the fibers are extracted using a dehusking machine.

3 The fibers are blown with air in a cleaning chamber to remove dust, seeds, and other impurities.

4 Cleaned fibers are soft, white, and fluffy – ready for further processing.

5 The purified fibers are collected and sorted for consistency in quality and texture.

6 Sorted tree cotton fibers are packed and stored in a clean, dry environment before use.
